

A. Overview of AI-assisted literature review workflow

B. Demo of AI-assisted literature review workflow

Project Vision

The question

Throughout history, societies have navigated crises that demanded quick, urgent, and widespread action. The first quarter of this century alone brought the deadliest terrorism in modern history, a global pandemic, and the sudden arrival of AI.

Curiously, crisis research tends to overlook the researchers who document it. We know a great deal about how communities behave under pressure. We know almost nothing about how scholars do.

The proverb we are testing

"To go fast, go alone; to go far, go together."

Team science repeats this constantly. Collaboration is said to buy reach — specialization, effort, collective intelligence — at a cost that matters most in a crisis: speed. The claim is old, intuitive, and almost entirely untested.

Approach

Sample crises that arrived suddenly and earned distinctive names: Hurricane Katrina, the 2008 financial crisis, ChatGPT. A crisis with a name of its own gives us a start date, and a start date is what makes a response measurable.

Measure	Definition
Speed	Days from the event to publication
Impact	Mentions in scholarly, news, and policy venues
Size	Number of co-authors

What we might expect to find

That researchers publish faster alone and further together — but that the returns to size diminish, and that the size which serves
